

Filling Station Fire Safety

Petrol stations are full of incredibly dangerous substances, and the potential for a fire catastrophe is immense.

The biggest risk is fuel dripping, leaking, or being poured from the nozzle.

The second stage of the fire risk assessment of your forecourt is to consider all of the people who could be adversely affected by a fire. Staff and customers are those most often at risk, but let's not forget delivery drivers, contractors, and engineers.

Rubbish bins, electrical equipment, heaters, and cardboard boxes full of stock are more likely causes of fire.

Having strict rules in place regarding smoking and all other forms of open flame and heat, and ensuring that any spillages are dealt with swiftly.
